

Campus Energy Monitoring Dashboard

Case ID: UC-4 **Time:** as shown on the portal **Submission:** one link

Background

A university campus with 14 buildings spends ₹2.4 crore a year on electricity. Meters are read manually once a month, so nobody knows which building or time of day wastes the most energy.

Your Task

1. Design a dashboard that shows energy use per building and per hour.
2. Decide which 5 numbers the campus director should see first, and why.
3. Propose 3 actions the dashboard should trigger automatically (alerts, reports, etc.).
4. Estimate the savings the campus could make in the first year and explain your assumptions.

What to Submit

- A document or slide deck (maximum 8 pages) with the dashboard design and savings estimate.
- Optional: a working dashboard or mock-up link.

Evaluation Criteria

- Understanding of the problem (25%)
- Quality and feasibility of the solution (35%)
- Use of data and measurable impact (25%)
- Clarity of presentation (15%)

Upload your work to Google Drive, GitHub or any website, make sure the link opens without signing in, and paste the link in the portal before the time ends.
